

Here is the canonical equation:

$$\mathcal{A} = \mu(\mathcal{O}^*)$$

And the mapping is:

$$\Psi : A \rightarrow \{0, 1\}^{256}$$

For local logs we discuss ggen, metadata, and δ . We use plain A , O^* , L . We also have feature.ttl file.

We have the morphism:

$$\mu : O^* \rightarrow A$$

And the ggen morphism:

$$\mu_{ggen} : O^* \rightarrow A$$

And variable type: $x : O$ And auxiliary map: $\alpha : O \rightarrow O^* \cup \{\perp\}$
